SUMMARY

Backend-focused engineer with nearly seven years building server-side Java systems, currently delivering on two flagship products at **S&P Global Market Intelligence**. Present work is distributed-systems engineering on an **Apache Ignite** data grid serving financial time-series and point-in-time data — owning features end to end, from HTTP API contract through distributed compute to regression coverage. Strongest in the hard parts: API platform performance, type-safe domain modelling, and the numerical correctness of financial calculations. An MBA in Finance makes the domain readable rather than something to be translated.

CORE TECHNICAL SKILLS

LANGUAGES	Java (8–21, J2EE), SQL / PL-SQL, JavaScript, TypeScript
BACKEND	Spring Boot, Spring MVC, Spring Security, Hibernate, Undertow, REST API design, OpenAPI / Swagger, Microservices
DISTRIBUTED & ASYNC	Apache Ignite (distributed cache, compute, services), ActiveMQ, JMS, event-driven design
DATA	MySQL, Oracle, SQL Server, Protobuf, JDBC / HikariCP, query & index optimisation
FRONTEND	Angular, React, JavaScript, jQuery
CLOUD & DEVOPS	AWS (S3, Secrets Manager), Docker, Kubernetes, Azure DevOps, GitHub Actions, CI/CD, Git, Gradle, Maven
TESTING	JUnit, TDD, Mockito, API regression suites (Bruno), code review
OBSERVABILITY	Datadog, Grafana
INTEGRATION	webMethods, XML / EDI transformation, FTP, pub–sub messaging

PROFESSIONAL EXPERIENCE

S&P Global — Market Intelligence Sept 2024 – Present
Senior Software Engineer III (Full-Stack) · India

ClariFI Phoenix — distributed financial data & analytics platform Jun 2026 – Present
Java 21 · Apache Ignite 2.18 · Undertow · OpenAPI · Protobuf · SQL Server · Gradle

- **Re-architected OpenAPI delivery from per-request assembly to a boot-time pipeline.** Built recursive \$ref resolution with cycle detection, syntax validation of every JSON and Ion spec fragment, and a pre-computed gzip payload with a SHA-256 ETag. An invalid fragment now fails application startup rather than surfacing as a runtime error, and repeat spec requests resolve to a 304 instead of re-serialising the document.
- **Designed and shipped the user-facing Data Catalog read API** (GET /api/data/sources, /api/data/queries), separating user-scoped access from the pre-existing admin CRUD surface and consolidating the duplicated admin/user handler logic onto shared abstract base handlers.
- **Authored two financial return functions for the platform's transform engine.** A rolling multi-period *geometric compounded return* incorporating price appreciation and intraperiod reinvested dividends, with explicit ex-dividend date classification; and a *cumulative return* supporting both rolling and expanding windows.
- **Implemented multi-window expansion for transform steps**, letting a single formula fan out into one series per requested window while preserving the grouping the response layer needs.
- **Hardened correctness at the platform's edges:** replaced string-typed frequency with the domain **Frequency** type across the linked-basket path and added alias support; fixed a null-pointer failure in the basket refresh endpoint; corrected date-range handling in the ATR, EMA and RSI period functions; and made **dataExport/close** idempotent so closing a session twice no longer errors.
- **Backed every change with automated coverage:** JUnit suites for the new transform functions and their failure modes, plus 18 Bruno API regression collections exercising valid, boundary and rejection cases.

Foreseer-AI — AI/NLP extraction from unstructured financial documents Sept 2024 – Jun 2026
Java · Spring Boot · Microservices · ActiveMQ · AWS · Azure DevOps · Docker · Kubernetes

- **Enhanced the NLP extraction model** behind a platform that turns unstructured financial documents into structured, queryable data, and owned the ETL pre-processing stage that normalises heterogeneous source documents into a

single XML representation for real-time downstream consumption.

- Integrated **ActiveMQ** message brokering to decouple document-processing microservices, converting synchronous hand-offs into asynchronous delivery and raising throughput.
- **Closed the loop from observability signal to database fix**: instrumented the services with **DataDog** and **Grafana**, then used those traces to target SQL indexing and query refactoring at the queries that were actually slow, rather than tuning blind.
- Moved credential and token handling to **AWS Secrets Manager**, bringing sensitive-data handling in line with the organisation's security standards.
- **Built the Azure DevOps delivery pipelines** for the microservice estate, automating build, test and release through Docker and Kubernetes so shipping became a repeatable pipeline run instead of a coordinated manual exercise.

Covalience

Jan 2023 – Aug 2024

Sr. Application Engineer II (Full-Stack) · Chandigarh, India

Plan4HealthCare — government healthcare budgeting platform

Java · J2EE · Spring Boot · Spring MVC · Angular · SQL · Docker · CI/CD

- Delivered server-side Java and J2EE features behind Spring REST APIs for a platform that lets government medical hospitals estimate and track budgets in real time, contributing to the architecture of critical features.
- Optimised SQL queries, stored procedures and triggers behind the platform's highest-traffic screens, where hospital budget estimates are calculated and maintained in real time.
- Built and configured CI/CD pipelines and Docker containers, standardising how the team shipped to each environment.
- Worked across the stack, pairing Angular front-end work with the backing microservices rather than handing off at the API boundary.

Innovatechs Technology Solutions

Jan 2020 – Jan 2023

Software Engineer (Java) · Hyderabad, India

Department of Energy, Abu Dhabi — government licensing platform

Java · J2EE · Spring Boot · Spring Security · Hibernate · webMethods · AWS S3 · EDI

- Engineered **webMethods** integrations in Java and J2EE to establish a B2B network for energy-plant licensing, focusing on system performance.
- Built RESTful APIs with Java, Hibernate and Spring Boot, secured with Spring Security and integrated with the Amazon S3 client.
- Developed and mapped **XML-to-EDI** document transformation for partner data exchange over FTP and reverse-invoke servers.
- Configured JDBC adapters for backing databases and managed patch migration between development environments through a pub-sub model.

EDUCATION

B.Tech — Electronics & Communication Engineering

B.K. Birla Institute of Engineering & Technology, Pilani · 2016

MBA — Finance

Jaipur National University · 2021

Domain grounding for financial-data and fintech engagements.

CERTIFICATIONS

Certified API Management Associate

Software AG

Certified webMethods.io Integration Associate

Software AG

ADDITIONAL

LANGUAGES

English — professional working proficiency

ALSO WORKED WITH

Redis, ElasticSearch
